"Sequence analysis of chromosome 19q13.4.";
"Sequence analysis of chromosome 19q13.4.";
Submitted (OCT-2000) to the EMBL/GenBank/DDBJ databases.
-!-FUNCTION: Suggested to be involved in kindling epileptogenesis and hippocampal plasticity.
-!- CATALYTIC ACTIVITY: Preferential cleavage: Arg-, Lys-.
-!- SUBCELLULAR LOCATION: Secreted.
                                                                                                                                                                                                                                                                                           expressed in the
                                                                                                                                                                                                                                                                     Isoid=060259-2; Sequence=VSP 005401;
TISSUE SPECIFICITY: Isoform 1 is predominantly expressed in TISSUE SPECIFICITY: Isoform 1 is expressed in adult brain and hippocampus. Both forms are also found in fetal brain and placenta. Not detected in kidney, spleen, liver and lung. SIMILARITY: Belongs to the peptidase SI family. Kallikrein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Alternative splicing, Glycoprotein, Hydrolase, Serine protease;

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

-!- FUNCTION: Possible multifunctional protease. Efficiently cleaves
bz-Phe-Arg-4-methylconmaryl-7-amide, a kallikrein substrate, and
weakly cleaves other substrates for kallikrein and trypsin.

TISSUE SPECIFICITY: Highest expression in the thyroid gland. Also
expressed in the prostate, salivary, and adrenal glands and in the
colon testis and kidney.
SIMILARITY: Belongs to the peptidase S1 family. Kallikrein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     IsoId=Q9H2R5-2; Sequence=VSP 005405;
Note=May be produced at very low levels due to a premature stop
codon in the mRNA, leading to nonsense-mediated mRNA decay;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               not yet known
